The KEYMACRO program is a standalone freeware application that you can use to create and use personalized keyboard shortcuts in Windows. The program allows you to record and manage a collection of keyboard shortcuts, defining them according to the actions you perform using your keyboard. These shortcuts can be used in the Windows Registry, so they will be active immediately after you create them, and the keys you use to trigger these shortcuts are also saved in the Registry, allowing them to be recalled later by simply pressing the keyboard shortcut you previously created. The KEYMACRO application does not require registration, and supports multiple languages, as well as an option to automatically synchronize the shortcuts with the Windows Registry. Additionally, the program offers basic options for you to control the installation process, including the ability to tweak the appearance and system requirements of the application. KEYMACRO works with any Windows version, and can also be used with Windows XP, Windows 7, 8, and 10. The utility does not support batch operations, nor can you define repeating tasks, meaning it does not work well if you are looking for a quick way to build a collection of keyboard shortcuts. One final word of advice: the KEYMACRO program is essentially a standalone, freeware application that you can use to create and manage personalized keyboard shortcuts in Windows. Magic Vocal Remover is a simple and intuitive application developed to provide you with the means to eliminate the vocals from your songs, in order to prepare them for your karaoke parties. The program is sufficiently simple to understand and handle, working in a 'point and shoot' kind of way, meaning all you need to do is load the source file and choose the output location, as well as the file name. It does not support drag and drop, meaning you will have to browse through your PC until you locate the items you wish to work with and select them manually. In order to start the operation, you have to press the 'Remove Vocals' button and the tool will begin processing your file, exporting the result to the previously set path and under the chosen name, allowing you to work with it however you please. Magic Vocal Remover does not support any customization features for the generated audios, like 'Channels', 'Frequency', 'Volume', 'Bitrate', nor can you decide on the level of vocal reduction, so it will apply the default settings for all the music files it exports. Additionally, the utility can only process MP3s, meaning that if your songs are in a different format, you will need to first convert them to the supported type of audio file. Moreover, the application does not provide you with the ability to work with multiple files at the same time. As such, if you want to remove the vocals from numerous songs, you will need to work with one item at a time, which can feel like a hassle, particularly if you intend to convert a lot of files. To summarize, Magic Vocal Remover is an interesting albeit limited software utility that is meant to help you prepare your songs for karaoke night, by allowing you to remove the vocals from various MP3s, so you and your friends can sing to them.
