lifetime" auction of the music collection of Jay Onrait, an ad executive who died suddenly in 2004 at the age of 47. The event, held on Tuesday at Fort Greene's PennSound recording studio, sold more than \$2 million in memorabilia and real estate, including a collection of Prince memorabilia, nearly a dozen Heeley guitars and instruments owned by Prince, and a vinyl-record collection filled with Prince's music, some of which was sold for \$43,000. The winning bid was \$1.2 million for the collection of Prince memorabilia, one of the largest collections of his material in the world. "This is like a dream come true," said Onrait's girlfriend, Michele Cole, before the auction. "It's the music that you love, and he made it for us. This is our art, and we are going to be able to enjoy it for the rest of our lives." The auction also included more than 40 Prince guitars and memorabilia, including several instruments that were donated to the auction. Among those were a black '77 Fender Squier Stratocaster that went for \$43,000 and an Eddie Van Halen guitar that went for \$25,000. "This is just beyond belief," said attorney Bob Merlis, who was overseeing the auction. Some music memorabilia from other artists was also sold, including an Elvis Presley guitar, a set of drums from the Beatles, and a collection of Dr. Demento's vinyl recordings. The event was put together by Merlis, Onrait's former boss, along with Kevin Mieke, a music executive who worked with Onrait. Onrait was a regular at recording sessions at the studio. The gathering has been called the "Gay White Party."For a conventional inspection apparatus, an exposure device such as a microscope, a camera, and the like is used to take images of each of a plurality of pieces of inspected matter (specimens), and thus it is possible to determine ca3bfb1094

The properties of silver-metal-semiconductor hybrids were investigated by using scanning tunneling microscopy and spectroscopy, scanning tunneling microscopy, and electrical conductivity. The resultant hybrid structures were consisted of an electron transporting layer of poly-3,4-ethylenedioxythiophene (PEDOT) and metallic silver. The metal-semiconductor interfaces of the hybrids were either metallic, as in (PEDOT)Ag, or semiconductor, as in (PEDOT)Ag(2), depending on the thickness of the electron transporting layer of PEDOT. The conductivity of the hybrids as a function of
